

# Alchemy, Alchemical Opus

## SECOND MONOGRAPHY

by  
Lapidus Lapidis

**Alchemy, synthesis of the laws of Nature.**

Alchemy mission since 1953

Lapidus Lapidis - Alchemy, synthesis of the laws of Nature.

# The double salt

Index

Introduction

The alchemical work of metals and salts

What is the means to modify a metal salt?

The secret fire of the wise salt

Properties of the double salt or salt of the wise

Sal opening

Purification of natural insulating double salt glycerin or a similar

Obtaining the double salt of the ashes (first and second phases of operation, the third and fourth stage operation in the third monography)

*\* It is important to remind the reader that alchemy is not chemistry, the procedure has a very different intent. Some procedures have similarities with the modern science of chemistry, it is nonetheless a highly differentiated something ordinary chemical process.*

## **Introduction**

This monography will investigate on the practical reality of Alchemy, will investigate the properties of the salts, specifically the double salt and will investigate the reason for the confusion, belief, that alchemy is speculative. We will investigate in what has been elusive to those who started in the alchemical practice should be treated as ignoring the elements that form the basis of the performance of the alchemical opus.

Alchemy is not philosophy, not speculative, alchemy is real, pragmatic, working in the alchemical laboratory. We must not confuse the process of alchemical opus with the process of the modern science of chemistry.

Why, it was thought that speculative alchemy ?.

For the uninitiated, those who did not achieve success in laboratory work, they developed a speculative philosophy, this has nothing to do with the practice alchemy.

In our exposition of the art of alchemy, gradually we expose the real work in the alchemical laboratory, without speculative philosophy. Solely practical.

How do you can check with the scientific method of alchemy reality ?.

With the pragmatic realization, with the completion of the alchemical laboratory work, with real facts, facts that are predictable, measurable.

### **The alchemical work of metals and salts**

Throughout the history of alchemy it has been experienced by many people of all conditions and social strata, however, success has been elusive for most people, and it has provided social resentment against alchemy.

The first mistake is not knowing of the elements that you must work in the laboratory.

A metal can not change its structure, because we induce use of acids or extreme temperatures, the explanation is that there is a way to work with metals that can change its molecular structure.

The means of working with metals is turning them into salts, the properties of the salts are suitable for achieving the alchemical work

### **What is the way to modify a metal salt?**

There are different routes or modes for the sales, we will investigate only the three routes or modes are: the Way of the sulfides. Way of nitrates. Way of acids and acetates.

Each one way or ways to get the salt is different in the way of proceeding (operate), as each way requires specific attention.

## **The secret fire of the wise salt**

It is one of the secrets to reveal, those neophytes who did not understand the nature of the secret fire, they could not succeed in the alchemical work.

The classical texts that are not speculative alchemy, operational texts, refer to the salt of the wise, and this salt is a synthesis (amalgam) double.

This synthesis or amalgamation, we can find in its natural state or work it in the laboratory.

The synthesis of the double natural salt, is the ideal. His name is Greek kainos, known as kainite, its chemical formulation is  $\text{Kmg}(\text{SO}_4)\text{Cl} \cdot 3\text{H}_2\text{O}$ .

However, and this reference is very relevant alchemy, this double salt should contain, potassium chloride and potassium sulfate also contains a fraction of magnesium chloride.

To be the secret fire must debug this double salt by removing the fraction of magnesium chloride. The double salt should be amalgamated by potassium chloride and potassium sulfate. This will refer you to the section of the double salt obtained from the forest

The double salt should have maximum purity, because otherwise it would not be helpful.

The disadvantage of natural double salt (kainite) is a diamantine which has properties, for it to be transported must be protected from external moisture, the external protection, it is usually an insulator similar to glycerin mode, the properties thus contaminates double salt, it must be purified.

## **Properties of the double salt or salt of the wise**

The most important property is that of attracting what operative alchemy texts refer, the universal spirit. Today, in modern language it is referred to as free energy or cosmic radiation.

The process of operational work in the alchemical laboratory is to retain this double salt, that specific radiation.

The synthesis of this double salt, will be used for the synthesis of salts with different alchemical ways.

## **Sal opening**

Is referred to prepare the salt, so that it can have all the properties required for the alchemical work.

It is necessary to reveal how the opening of the salt, and this is done with solar radiation, water dew will open with the lunar radiation. I refer to this posteriori.

## **Purification of natural double salt, glycerin insulation or a similar**

The simplest way is the aqueous solution, and recovery of the salts, simple washing and drying operation

Potassium chloride and potassium sulfate are poorly soluble in the aqueous medium of water. This is favorable because it can separate the soluble salts that are not necessary

## **Obtaining the double salt of the ashes**

Obtaining the double salt is a long and difficult procedure. In this monography I will explain the general principles, in the next monography we refer specifics of alchemical operations.

### *First phase of the operation*

To produce the double salt, we need to reduce to ashes the ideal plant, in the ideal time and with the right environmental conditions, the coincidence of it all, is a very complex and complicated thing.

First stage, find an oak tree in winter and in the descending moon, these indications are relevant and can not be ignored .

The cut wood is placed to dry in the sun and moonlight for two years, until the wood is completely dry.

The next phase is to burn wood to keep it down to embers and smoldering fire in the embers (in an enclosed area, not outdoors), the ashes over potassium salts enriched.

Next phase, the ashes are screened again and again, until a fine and free mixture of coarse impurities. Choose a finer sieve for each operation until the mixture of fine ash. The process is long and tedious,

### *Second phase of the operation*

Pour water Dew (next monograph, I will explain how water alchemical Dew is obtained) in the ashes, in the amount of five centimeters in a bucket (common size used in household chores) with five liters of dew water, it should be left until the next day, in the light of the sun and the moon (lunar phases should provide) the operation of dissolving the ashes with water dew will be repeated up to four times.

A reddish water is obtained, this water containing the three salts. Sulphate of potash, potassium chloride and carbonate of potash.

(first and second phases of operation, the third and fourth phase operation in the third monograph will be referred to in its entirety)
